Design Note No. 18*

Subject: "Unattached" ES drawings

Most Engineering Standard (ES) drawings are contained, because of their subject matter, in either sections of the national engineering handbook, technical releases, design notes, or other similar publications. Thus, such ES drawings are available by procurement of the publications in which they appear.

This design note provides a mechanism by which otherwise "unattached" ES drawings may be obtained.

These "unattached" ES drawings are contained herein. They group naturally into three categories. These are:

Group A: Schedules of National Standard Detail Drawings
- ES- 94 Series "B" Straight Drop Spillways
- ES-169 Standard Covered Risers
- ES-180 Standard Open Risers
- ES-186 Standard Impact Basins (also available in TR-49)
- ES-195 Standard Conduit Details
- ES-231 Standard Baffle Risers

Group B: Drop Inlet Spillway Standards
- ES-150 Covered Top Riser
- ES-151 Rectangular Open Top Riser
- ES-152 Square Open Top Riser
- ES-153 Restricted Flow Riser
- ES-154 Pipe Conduits
- ES-155 Pipe Conduit Outlets
- ES-156 Low Stage Inlets
- ES-232 Baffle Top Riser

Group C: Miscellaneous
- ES- 8 Circular Curve Pipe Layout Information
- ES- 11 Drop Spillway Nappe
- ES-157 Properties of Steel Angles with Equal Legs

*Prepared by Edwin S. Alling, Head, Design Unit, National Engineering Staff, Lanham, Maryland.

STANDARD PLANS: SERIES "B" REINFORCED CONCRETE DROP SPILLWAYS SCHEDULE SHOWING DRAWING NUMBER, CUBIC YARDS OF CONCRETE, AND POUNDS OF REINFORCING STEEL.

(1) Notes: Drawing No., cu. yds of concrete, and lbs.. of reinforcing steel are listed vertically in order for each size. Each drawing number shall be prefixed with the letters E. S.

(2) *The ratio of L + h is less than 2.0 for these values. Correction for hydraulic losses due to end contractions must be considered in the solution of the weir formula, for discharge capacity, before these drop spillways can be applied.

(1) Notes: Drawing No., cu. yds of concrete, and lbs.. of reinforcing steel are listed vertically in order for each size. Each drawing number shall be prefixed with the letters E. S.

(2) *The ratio of L ÷ h is less than 2.0 for these values. Correction for hydraulic losses due to end contractions must be considered in the solution of the weir formula, for discharge capacity, before these drop spillways can be applied.

Definition of Symbols:

F = net drop from crest of weir to top of transverse sill in ft
h = total depth of weir in ft
L = length of weir in ft

Load Assumptions:

1. Weight of concrete = 150 lbs/ft^3
2. Weight of earth fill = 100 lbs/ft^3
3. Weight of equivalent fluid against headwall = 62.4 lbs/ft^3
4. Weight of equivalent fluid against sidewalls = 35 lbs/ft^3
5. Weight of equivalent fluid against wingwalls = 35 lbs/ft^3
6. Weight of equivalent fluid against headwall extensions = 5 lbs/ft^3
7. Allowable soil bearing pressure = 2000 lbs/ft^2

Allowable unit working stresses (Class B Concrete):

(1) Ultimate compressive strength f'_c = 3000 lbs/sq in.
(2) Extreme fiber stress in compression f_c = 1200 lbs/sq in.
(3) Working stress for reinforcing steel f_s = 20,000 lbs/sq in.

STANDARD PLANS: STANDARD COVERED RISERS
SELECTION OF STANDARD DETAIL DRAWINGS

Key to Drawing Numbers

The drawing numbers of the Standard Detail Drawings for Standard Covered Risers are given by:

$$ES\text{-}30DD\text{-}[NN]_{ih}[NN]_{is}[\tfrac{E}{R}]$$

where

DD ≡ D = pipe conduit diameter, inches.

$[NN]_{ih} \equiv N_{ih}$ = vertical distance from pipe invert at the riser to crest of the covered inlet of the riser, ft.

$[NN]_{is} \equiv N_{is}$ = vertical distance from pipe invert at the riser to soil surface, ft. The soil surface is either the sediment or the embankment (berm) surface.

$[\tfrac{E}{R}]$ ≡ riser is designed to be located in the [embankment / reservoir area].

Standard Detail Drawings

Each set of Standard Detail Drawings for a Standard Covered Riser consists of four sheets. Each Standard Covered Riser is designed for a specific combination of N_{ih} and N_{is}.

A set of Standard Detail Drawings may be adapted to a range of riser heights. The height may vary from the full design height given by N_{ih} in the drawing number to five feet less than N_{ih}. The only exception to the preceding statement occurs with risers having D = 36 in. and N_{ih} = 15 ft, for which the height range is four feet.

The design combinations of N_{ih}, N_{is}, and N_{sh} for each pipe conduit diameter together with criteria for selecting the Standard Detail Drawings to be used for a given adaptation, are given on sheet 2 of this drawing.

Adaptation of Standard Detail Drawings

After the particular Standard Detail Drawings to be used have been selected, they must be adapted to the desired riser height. The adaptation is accomplished by completing the fill-ins left blank on sheets 1 and 3 of the drawings. The information required is self-explanatory. It consists of vertical dimensions, reinforcement bar lengths, reinforcement bar quantities, and volumes and weights of materials.

Volumes and Weights of Materials

Quantity schedules for each family of Standard Covered Risers are contained on the following sheets of this drawing:

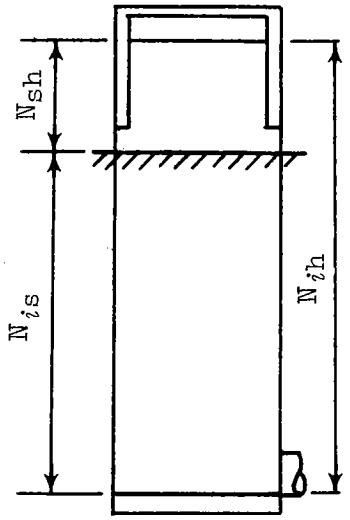
Pipe Conduit Diameter	Sheet
D = 24 in.	3
30	4
36	5
42	6
48	7

Wind Projections

Risers to be located in the embankment are not designed for wind. An allowable wind projection is tabulated for these risers on the sheets containing the quantity schedules. The tabulated allowable wind projection was computed for the conditions:

(1) No embankment is placed in the vicinity of the riser.
(2) Moist soil condition, allowable earth bearing pressures are:
   $P_{max} \leq 4$ ksf
   $P_{aver} \leq 2$ ksf
   $P_{min} \geq 0$ ksf
(3) Wind acts on the sidewall at 50 psf.
(4) The constructed riser height, above the top of the footing, does not exceed the allowable wind projection.

The assumption is made that the allowable wind projection for other conditions of embankment placement and riser height is not less than that tabulated. Thus, the tabulated allowable wind projection may be considered as the allowable vertical distance between the surface of the embankment and the top of the riser at any stage of construction.



Selection of Standard Detail Drawings

The selection of the particular Standard Detail Drawings to be adapted to the desired riser height is made as follows:

The N_{ih} of the Standard Detail Drawings to be selected is the smallest value of N_{ih} which is greater than or equal to the N_{ih} desired at the specific site and the N_{sh} of the Standard Detail Drawings to be selected is the greatest value of N_{sh} which is less than or equal to the N_{sh} desired at the specific site.

Thus:

N_{ih} of the standard $\geq N_{ih}$ desired at specific site

N_{sh} of the standard $\leq N_{sh}$ desired at specific site.

Four examples are given. These examples assume a 36 in. pipe conduit diameter and risers will be located in the embankment.

Example 1.
N_{ih} desired = 30.0', N_{sh} desired = 13.0', therefore select ES-3036 - 3020E

Example 2.
N_{ih} desired = 28.5', N_{sh} desired = 13.0', therefore select ES-3036 - 3020E

Example 3.
N_{ih} desired = 27.0', N_{sh} desired = 13.0', therefore select ES-3036 - 3020E

Example 4.
N_{ih} desired = 27.0', N_{sh} desired = 15.0', therefore select ES-3036 - 3015E.

STANDARD PLANS: STANDARD OPEN RISERS
SELECTION OF STANDARD DETAIL DRAWINGS

Key to Drawing Numbers

The drawing numbers of the Standard Detail Drawings for Standard Open Risers are given by:

$$ES\text{-}31DD\text{-}[NN]_{ih}[NN]_{is}[\tfrac{E}{R}]$$

where

DD $\equiv$ D = pipe conduit diameter, inches.

$[NN]_{ih} \equiv N_{ih}$ = vertical distance from pipe invert at the riser to crest of the Open Riser Inlet, ft.

$[NN]_{is} \equiv N_{is}$ = vertical distance from pipe invert at the riser to soil surface, ft. The soil surface is either the sediment or the embankment (berm) surface.

$[\tfrac{E}{R}] \equiv$ riser is designed to be located in the [embankment / reservoir area].

Standard Detail Drawings

Each set of Standard Detail Drawings for a Standard Open Riser consists of four sheets. The Open Riser Inlet is shown on sheet 4.

The Standard Open Risers tabulated on sheet 2 of this drawing are designed for $N_{ih} = N_{is}$.

A set of Standard Detail Drawings may be adapted to a range of riser heights. The height may vary from the full design height given by N_{ih} in the drawing number to five feet less than N_{ih}. The only exception to the preceding statement occurs with risers having D = 36 in. and N_{ih} = 10 ft, for which the height range is four feet.

Selection of Standard Detail Drawings

The set of Standard Detail Drawings to be selected is that having the smallest N_{ih} which is greater than or equal to the N_{ih} desired at the specific site.

Adaptation of Standard Detail Drawings

After the Standard Detail Drawings have been selected, they must be adapted to the desired riser height. The adaptation is accomplished by completing the fill-ins on sheets 1 and 3 of the drawings. The value to be inserted in a fill-in is either a vertical dimension, a reinforcement bar length, a reinforcement bar quantity, a reinforcement bar weight, or a concrete volume.

Volumes and Weights of Materials

Quantities for Standard Open Risers are given on sheet 2 of this drawing.

Wind Projections

Risers to be located in the embankment are not designed for wind load. An allowable wind projection is tabulated for these risers on sheet 2. The tabulated allowable wind projection was computed for the conditions:

(1) No embankment is placed in the vicinity of the riser.

(2) Moist soil condition, allowable earth bearing pressures are:

$p_{max} \leq 4$ ksf

$p_{av} \leq 2$ ksf

$p_{min} \geq 0$ ksf

(3) Wind load on the sidewall is 50 psf.

(4) The constructed riser height, above the top of the footing, does not exceed the allowable wind projection.

The assumption is made that the allowable wind projection for other conditions of embankment placement and riser height is not less than that tabulated. Thus, the tabulated allowable wind projection may be considered as the allowable vertical distance between the surface of the embankment and the top of the riser at any stage of construction.

STANDARD PLANS: STANDARD BAFFLE RISERS
SELECTION OF STANDARD DETAIL DRAWINGS

Key to Drawing Numbers

The drawing numbers of the Standard Detail Drawings for Standard Baffle Risers are given by:

$$ES\text{-}32DD\text{-}[NN]_{ih}[NN]_{is}[^{E}_{R}]$$

where

DD ≡ D = pipe conduit diameter, inches

$[NN]_{ih} \equiv N_{ih}$ = vertical distance from pipe invert at the riser to crest of the Baffle Riser Inlet, ft.

$[NN]_{is} \equiv N_{is}$ = vertical distance from pipe invert at the riser to soil surface, ft. The soil surface is either the sediment or the embankment (berm) surface.

$[^{E}_{R}]$ ≡ riser is designed to be located in the [embankment / reservoir area].

Standard Detail Drawings

Each set of Standard Detail Drawings for a Standard Baffle Riser consists of four sheets. The Baffle Riser Inlet is shown on sheet 4.

The Standard Baffle Risers tabulated on sheet 2 of this drawing are designed for $N_{ih} = N_{is}$.

A set of Standard Detail Drawings may be adapted to a range of riser heights. The height may vary from the full design height given by N_{ih} in the drawing number to five feet less than N_{ih}. The only exception to the preceding statement occurs with risers having D = 36 in. and N_{ih} = 10 ft, for which the height range is four feet.

Selection of Standard Detail Drawings

The set of Standard Detail Drawings to be selected is that having the smallest N_{ih} which is greater than or equal to the N_{ih} desired at the specific site.

Adaptation of Standard Detail Drawings

After the Standard Detail Drawings have been selected, they must be adapted to the desired riser height. The adaptation is accomplished by completing the fill-ins on sheets 1 and 3 of the drawings. The value to be inserted in a fill-in is either a vertical dimension, a reinforcement bar length, a reinforcement bar quantity, a reinforcement bar weight, or a concrete volume.

Volumes and Weights of Materials

Quantities for Standard Baffle Risers are given on sheet 2 of this drawing.

Wind Projections

Risers to be located in the embankment are not designed for wind load. An allowable wind projection is tabulated for these risers on sheet 2. The tabulated allowable wind projection was computed for the conditions:

(1) No embankment is placed in the vicinity of the riser.

(2) Moist soil condition, allowable earth bearing pressures are:

$P_{max} \leq 4$ ksf

$P_{av} \leq 2$ ksf

$P_{min} \geq 0$ ksf

(3) Wind load on the sidewall is 50 psf.

(4) The constructed riser height, above the top of the footing, does not exceed the allowable wind projection.

The assumption is made that the allowable wind projection for other conditions of embankment placement and riser height is not less than that tabulated. Thus, the tabulated allowable wind projection may be considered as the allowable vertical distance between the surface of the embankment and the top of the riser at any stage of construction.

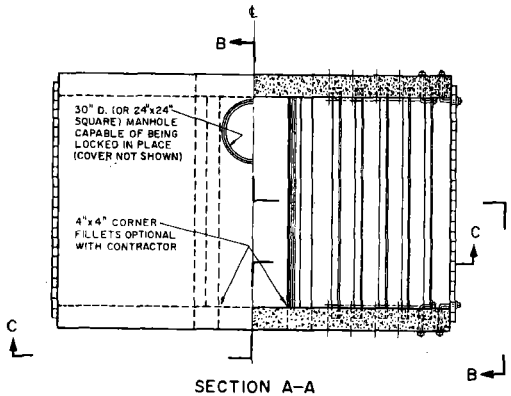
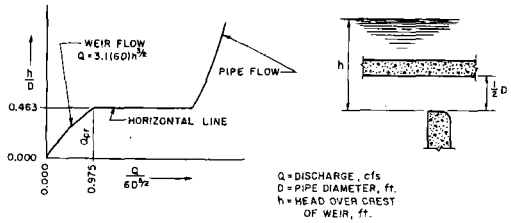
SOIL CONSERVATION SERVICE
ENGINEERING DIVISION - DESIGN UNIT

STANDARD DWG. NO.
ES-231
SHEET 2 OF 2
DATE 3-80



SECTION A–A
FOOTING AND SPIGOT WALL FITTING NOT SHOWN



Q = DISCHARGE, cfs
D = PIPE DIAMETER, ft.
h = HEAD OVER CREST OF WEIR, ft.

STAGE–DISCHARGE RELATION
FOR COVERED TOP RISER OF PROPORTIONS SHOWN

SCOPE

1. The covered top riser is a standard for two-stage risers, and also for single-stage risers in multi-purpose sites if the maximum sediment elevation is set at least (2D+12") below the crest.
2. Height Ranges of Riser:
   High stage, H_2 = (2D+6") to 20 feet
   Low stage, H_1 = 0 to 30 feet
   Sum, $H = H_2 + H_1 \leq 40$ feet.

CRITERIA

1. Pipe Diameters and Associated Discharges:

D	$Q_{pr} = 0.975(6D^{5/2})$	$Q_{max} = \frac{30}{4}\pi D^2$
24	33	94
30	58	148
36	92	212
42	135	288
48	188	376

Note: Maximum allowable nominal velocity in pipe = 30 fps.

2. Hydraulic Losses (pipe flow):
   Head loss between pool water surface and the projected hydraulic grade line at the pipe entrance = 1.0 times the velocity head in the pipe.
3. Trashracks:
   Required net area for National Standard Detailed Drawings–to be computed from Q_{max} as listed in Criteria (1), and an allowable average velocity of 2.0 fps.
   All bolts, nuts, pipe sleeves, and grating, to be galvanized or otherwise protected by corrosion resistant coating except when made of aluminum.
4. Cover slab live load = 100 psf plus weight of any equipment on the slab.
5. Flotation:
   When riser is in reservoir– the ratio of the weight of riser to the weight of the volume of water displaced by the riser shall not be less than 1.5
   When riser is in the embankment– add to the weight of the riser, the buoyant weight of submerged fill over footing projections.
6. Dry Dams:
   Where sediment is not a problem – set crest of low stage inlet at required elevation.
   Where sediment is a problem – use a series of slotted openings up the longitudinal sides. Trashracks are not required for these openings.
7. Materials:
   Concrete: Class B, f'_c = 4000 psi, f_c = 1600 psi. Reinforcing Steel: Intermediate grade.
   Trashrack: Structural steel or structural aluminum.

NOTES

1. Riser Analyses: Standards to be developed for risers located in the embankment (at berm) and for risers located in reservoir area. 2. Round Bottom: May be obtained by use of a pipe cut longitudinally along a diameter, or may be formed by removable semi-circular forms acceptable to the engineer. 3. Drainage of Pool: Provision of means of draining pool to be handled as a modification of these standards by the Field.

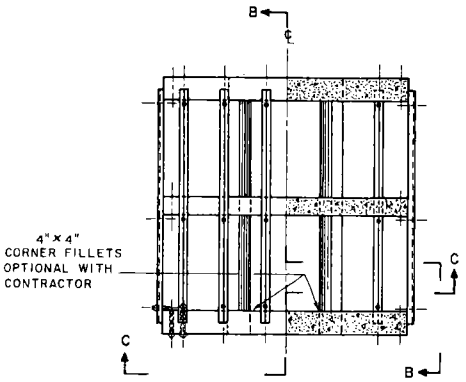
STANDARD FOR
COVERED TOP RISER

U. S. DEPARTMENT OF AGRICULTURE
SOIL CONSERVATION SERVICE

Designed ENGINEERING DIV.	Date 1-63	Approved by	
Drawn E.S.A.	1-63	Title	
Traced G.B.G	2-63	Title Sheet	Drawing No.



SECTION A-A

FOOTING AND SPIGOT WALL FITTING NOT SHOWN

SCOPE

1. The rectangular open top riser is a standard for one and two-stage risers.
2. Height Ranges of Riser:
   High stage, H_2 = up to 20 ft.
   Low stage, H_1 = up to 30 ft.
   Sum, $H = H_2 + H_1 \leq 40$ ft.
   If one stage riser: $H \leq 40$ ft.

CRITERIA

1. Pipe Diameters and Associated Discharges:

D	$Q_{max.} = \frac{30}{4}\pi D^2$
24	94
30	148
36	212
42	288
48	376

   Note: Maximum allowable nominal velocity in pipe = 30 fps

2. Trashracks:
   Required net area for National Standard Detailed Drawings – to be computed from Q_{max} as listed in Criteria (1) and an allowable average velocity of 2.0 fps.
   All bolts, nuts, pipe sleeves, and grating to be galvanized or otherwise protected by corrosion resistant coating except when made of aluminum.
   Grating may be used in front of weir crest (but not for more than 9" above crest). If grating used, check required net area of trashrack, a revision of the anti-vortex wall dimensions may be necessary.
3. Anti-vortex Walls:
   Omit center anti-vortex wall when D < 36". The bottom of the anti-vortex walls may be formed with a 45° slope when the riser is located in the reservoir.
4. Flotation:
   When riser is in reservoir – the ratio of the weight of riser to the weight of the volume of water displaced by the riser shall not be less than 1.5.
   When riser is in embankment – add to the weight of the riser, the buoyant weight of the submerged fill over the footing projections.
5. Dry Dams:
   Where sediment is not a problem – set crest of single stage riser, or crest of low stage inlet of two-stage riser, at required elevation.
   Where sediment is a problem – use a series of slotted openings up the longitudinal sides. Trashracks are not required for these openings.
6. Materials:
   Concrete : Class B, f'_c = 4000 psi, f_c = 1600 psi.
   Reinforcing Steel : Intermediate grade.
   Trashrack : Structural steel or structural aluminum.

NOTES:

1. Riser Analyses:
   Standards to be developed for risers located in the embankment (at berm) and for risers located in the reservoir area.
2. Round Bottom: May be obtained by use of a pipe cut longitudinally along a diameter, or may be formed by removable semi-circular forms acceptable to the engineer.
3. Drainage of Pool:
   Provision of means of draining pool to be handled as a modification of these standards by the Field.

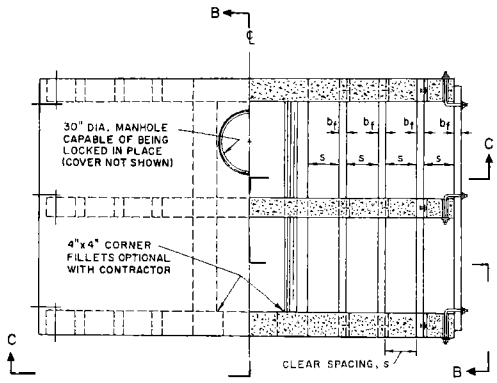
DROP INLET SPILLWAYS STANDARD FOR RECTANGULAR OPEN TOP RISER

U. S. DEPARTMENT OF AGRICULTURE
SOIL CONSERVATION SERVICE

	Date	
Designed ENGINEERING DIV.	1-63	Approved by
Drawn E.S.A.	1-63	Title



SECTION A-A

FOOTING AND SPIGOT WALL FITTING NOT SHOWN

SCOPE

1. THE BAFFLE TOP RISER IS A STANDARD FOR ONE AND TWO-STAGE RISERS.
2. HEIGHT RANGES OF RISER:
   $N_{sh} \leq 20$ FT.
   $N_{ts} \leq 35$ FT.
   $N_{sh} \leq 40$ FT.

CRITERIA

1. PIPE DIAMETERS AND ASSOCIATED DISCHARGES:

D	$Q_{MAX.} = \frac{30}{4}\pi D^2$
24	94
30	147
36	212
42	289
48	377

NOTE: MAXIMUM ALLOWABLE NOMINAL VELOCITY IN PIPE = 30 FPS

2. HYDRAULICS:
   THE WEIR DISCHARGE COEFFICIENT, C:
   C = 3.1 (CLEAR WATER FLOW)
   C = 2.0 (TRASH LADEN FLOW)
   FOR D x 3D RISERS WITH ROUND BOTTOMS, THE ENTRANCE HEAD LOSS COEFFICIENT, K_e:
   K_e = 0.60 (CLEAR WATER FLOW)
   K_e = 0.65 (TRASH LADEN FLOW)
   DURING PIPE FLOW, THE HEAD LOSS BETWEEN POOL WATER SURFACE AND THE PROJECTED HYDRAULIC GRADE LINE AT THE PIPE ENTRANCE = K_e TIMES THE VELOCITY HEAD IN THE PIPE.

3. BAFFLES:
   REQUIRED NET AREA FOR NATIONAL STANDARD DETAILED DRAWINGS - TO BE COMPUTED FROM Q_{MAX} AS LISTED IN CRITERIA (1) AND AN ALLOWABLE AVERAGE VELOCITY OF 2.5 FPS.
   THE CLEAR HORIZONTAL DISTANCE BETWEEN BAFFLES, s:
   $\frac{D}{3} \leq s \leq \frac{D}{2}$
   THE VERTICAL OVERLAP BETWEEN BAFFLES, f:
   $f \geq 3"$
   THE CLEARANCE BETWEEN THE COVER SLAB AND THE TOP-MOST BAFFLE, u:
   $2" \leq u \leq 3"$
   ALL BOLTS, NUTS, AND PIPE SLEEVES TO BE GALVANIZED OR OTHERWISE PROTECTED BY CORROSION RESISTANT COATING EXCEPT WHEN MADE OF ALUMINUM.

4. COVER SLAB:
   COVER SLAB LIVE LOAD = 100 PSF PLUS WEIGHT OF EQUIPMENT ON THE SLAB.
   $L_o = B(s + b_f)$, ROUNDED UP TO NEXT INCH
   B = NUMBER OF BAFFLES ON ONE SIDE OF INLET
   THE DISTANCE BETWEEN THE WEIR CREST AND THE UNDERSIDE OF THE COVER SLAB, N, IS EQUAL TO OR GREATER THAN THE HEAD OVER THE CREST AT WHICH THE CONDUIT PRIMES AND FULL CONDUIT FLOW BEGINS FOR "WITH TRASH" CONDITIONS, I.E., K_e = 0.65 AND C = 2.0

5. ANTI-VORTEX WALLS:
   OMIT CENTER ANTI-VORTEX WALL WHEN D < 36".

6. FLOTATION:
   WHEN RISER IS IN RESERVOIR - THE RATIO OF THE WEIGHT OF RISER TO THE WEIGHT OF THE VOLUME OF WATER DISPLACED BY THE RISER SHALL NOT BE LESS THAN 1.5.
   WHEN RISER IS IN EMBANKMENT - SAME AS ABOVE, BUT ADD TO THE WEIGHT OF THE RISER, THE BUOYANT WEIGHT OF THE SUBMERGED FILL OVER THE FOOTING PROJECTIONS.

7. DRY DAMS:
   WHEN SEDIMENT IS NOT A PROBLEM - SET CREST OF SINGLE STAGE RISER, OR CREST OF LOW STAGE INLET OF TWO-STAGE RISER, AT REQUIRED ELEVATION.
   WHERE SEDIMENT IS A PROBLEM - USE A SERIES OF SLOTTED OPENINGS UP THE LONGITUDINAL SIDES (SEE ES-151). TRASHRACKS ARE NOT REQUIRED FOR THESE OPENINGS.

8. MATERIALS:
   CONCRETE : CLASS 4000, f_c = 1600 PSI.
   REINFORCING STEEL: GRADE 40
   BAFFLE : AMERICAN STANDARD CHANNELS, MISCELLANEOUS CHANNELS, STRUCTURAL STEEL TUBING OR REINFORCED CONCRETE BEAMS.

NOTES:

1. RISER ANALYSES:
   STANDARDS TO BE DEVELOPED FOR RISERS LOCATED IN THE EMBANKMENT (AT BERM) AND FOR RISERS LOCATED IN THE RESERVOIR AREA.
2. ROUND BOTTOM:
   MAY BE OBTAINED BY USE OF REMOVABLE SEMI-CIRCULAR FORMS ACCEPTABLE TO THE ENGINEER.
3. DRAINAGE OF POOL:
   PROVIDING FOR MEANS OF DRAINING POOL TO BE HANDLED AS A MODIFICATION OF THESE STANDARDS BY THE FIELD.

OPENING IN UPSTREAM ENDWALL NEAR BASE OF RISER TO BE HANDLED AS A

DROP INLET SPILLWAYS STANDARD FOR BAFFLE TOP RISER

U. S. DEPARTMENT OF AGRICULTURE
SOIL CONSERVATION SERVICE

		Date	
Designed	NES	3-81	Approved by
Drawn	H.J.G.	3-81	Title

SCOPE

1. The square open top riser is a standard for one and two-stage risers.

2. Height Ranges of Riser:
   High stage: H_2 = up to 20 feet. (If one-stage riser, H ≤ 40 feet.)
   Low stage: H_1 = up to 30 feet.
   Sum, $H = H_2 + H_1 \leq 40$

CRITERIA

1. Pipe Diameters and Associated Discharges:

D	$Q_{max} = \frac{30}{4}\pi D^2$
24	94
30	148
36	212
42	288
48	376

Note: Maximum allowable nominal velocity in pipe = 30 fps.

2. Trashracks:
   Fabrication – welded or bolted.
   Required net area for National Standard Detailed Drawings – to be computed from Q_{max}, as listed in Criteria (1) and an allowable average velocity of 2.0 fps.
   All bolts, nuts, pipe sleeves, and grating, to be galvanized or otherwise protected by corrosion resistant coating except when made of aluminum.
   Grating may be used at weir crest level (but not for more than 9" above crest).
   Required net area is exclusive of any grated area.

3. Flotation:
   When riser is in reservoir – the ratio of the weight of riser to the weight of the volume of water displaced by the riser shall not be less than 1.5.
   When the riser is in embankment – add to the weight of the riser, the buoyant weight of the submerged fill over the footing projections.

4. Dry Dams:
   Where sediment is not a problem – set crest of single stage riser or crest of low stage inlet of two-stage riser, at required elevation.
   Where sediment is a problem – use a series of slotted openings up the long longitudinal sides. Trashracks are not required for these openings

5. Materials:
   Concrete: Class B, f'_c = 4000 psi, f_c = 1600 psi.
   Reinforcing Steel: Intermediate grade.
   Trashrack: Structural steel or structural aluminum.

NOTES

1. Riser Analyses:
   Standards to be developed for risers located in the embankment (at berm) and for risers located in the reservoir area.

2. Round Bottom: May be obtained by use of a pipe cut longitudinally along a diameter, or may be formed by removable semi-circular forms acceptable to the engineer.

3. Drainage of Pool:
   Provision of means of draining pool to be handled as a modification of these standards by the Field.

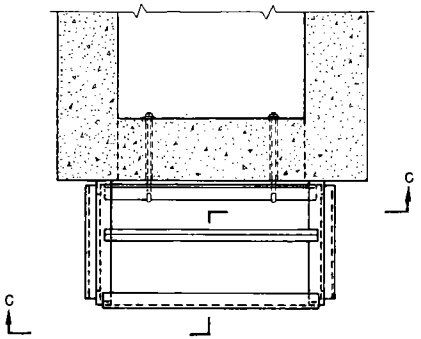
SECTION A—A



SECTION B—B

SCOPE:

1. These details apply to the standard covered top, rectangular open top, and square open top risers.

CRITERIA:

1. Trashracks:
   - Required net area for National Standard Detailed Drawings—to be computed from C_{max} for the low stage inlet and an allowable average velocity of 2.0 fps.
   - Grating may be used at low stage inlet level, but required net area is exclusive of any grated area.
   - Fabrication—may be welded or bolted. Welded shown here.
   - All bolts, nuts, pipe sleeves, and grating to be galvanized or otherwise protected by corrosion resistant coating except when made of aluminum.
   - Number and spacing of $\frac{5}{8}$" ϕ bolts, $\frac{3}{4}$" ϕ pipe sleeves and support angles to be determined as required for strength and rigidity.
2. Materials:
   - Structural steel or structural aluminum.

STRUCTURAL DESIGN: CIRCULAR CURVE, DIMENSIONING AND LAYOUT FOR REINFORCED CONCRETE SECTIONAL PIPE.

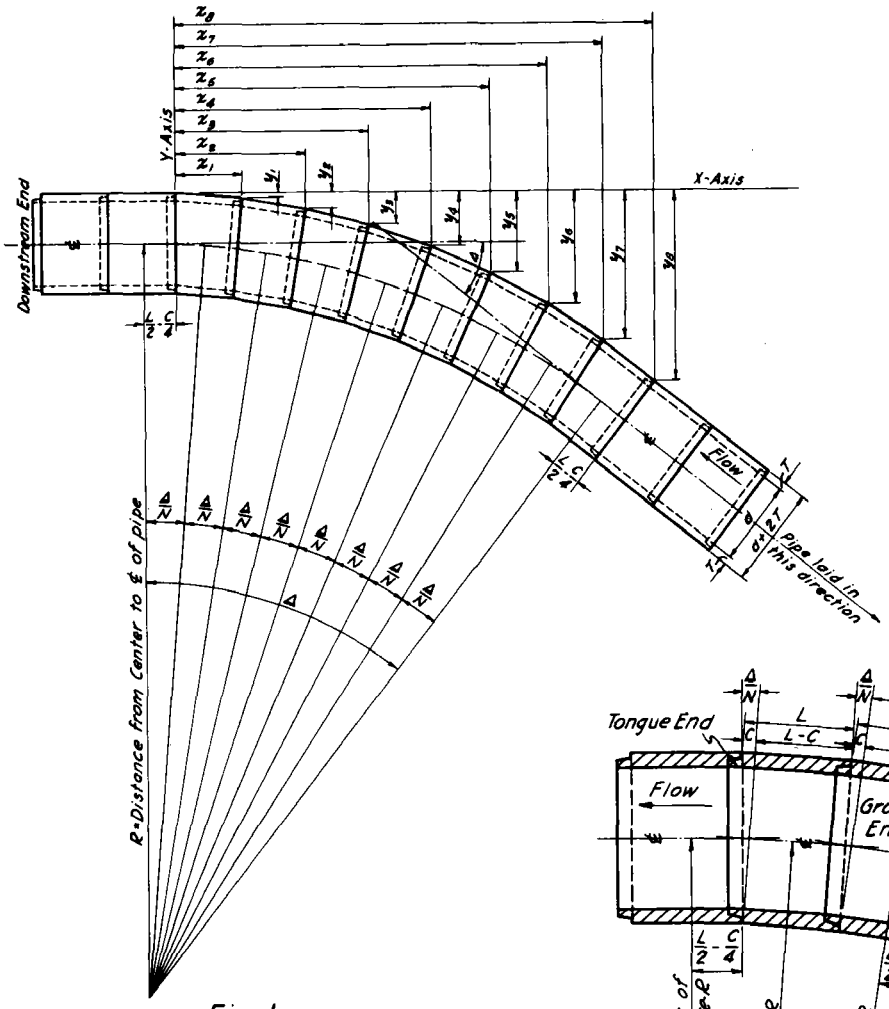

Fig. 1

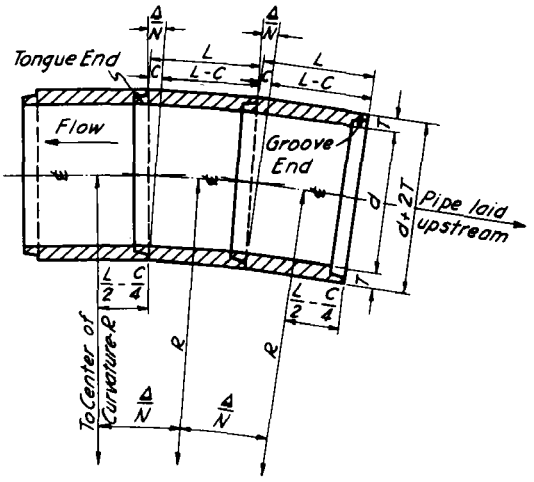

Fig. 2

FORMULAS

1. Tan. $\frac{\Delta}{N} = \frac{C}{d+2T}$; Largest recommended $\frac{\Delta}{N} = 5°$

   $R = \left[\frac{2L-C}{4C}\right]\left\{\sqrt{(d+2T)^2+C^2}+(d+2T)\right\}$ -ft.

   Since C is small compared to (d+2T) when $\frac{\Delta}{N} \leq 5°$, C^2 may be neglected under the radical sign. Then

2. $R = \text{approx.} \frac{(2L-C)(d+2T)}{2C}$ -ft; if $\frac{C}{d+2T} < 0.08$

3.(a) $x_1 = L \cos \Delta/N$ -ft.

(b) $x_2 = L[\cos \Delta/N + \cos 2(\Delta/N)]$ -ft.

. . . . . .

$x_n = L[\cos \Delta/N + \cos 2(\Delta/N) + \cos 3(\Delta/N) + \cdots + \cos n(\Delta/N)]$ -ft.

$x_n = L\left[\frac{\sin(n+1/2)(\Delta/N) - \sin 1/2(\Delta/N)}{2 \sin 1/2(\Delta/N)}\right]$ -ft.

4(a) $y_1 = L \sin \Delta/N$ -ft.

(b) $y_2 = L[\sin \Delta/N + \sin 2(\Delta/N)]$ -ft.

. . . . . .

$y_n = L[\sin \Delta/N + \sin 2(\Delta/N) + \sin 3(\Delta/N) + \cdots + \sin n(\Delta/N)]$ -ft.

$y_n = L\left[\frac{\cos 1/2(\Delta/N) - \cos(n+1/2)\Delta/N}{2 \sin 1/2(\Delta/N)}\right]$ -ft.

NOMENCLATURE AND SYMBOLS

- R = Radius of curvature - ft.; Distance from center of curve to ℄ of pipe.
- Δ = Central angle of curve = Angle between ℄ tangents.
- N = Number of identically cut sections in curve.
- d = Inside diameter of pipe - ft.
- T = Wall thickness of concrete pipe - ft.
- L = Length of long side of elbow section - ft.
- C = Cut or bevel on tongue end of pipe section - ft. See Fig. 2.
- x_n = Offset dimension of outside edge of n^{th} section from Y-axis - ft.
- y_n = Offset dimension of outside edge of n^{th} section from X-axis - ft.

REFERENCE

U. S. DEPARTMENT OF AGRICULTURE
SOIL CONSERVATION SERVICE
ENGINEERING STANDARDS UNIT

STANDARD DWG. NO.
ES-8
SHEET 1 OF 3
DATE 1-10-50

STRUCTURAL DESIGN: CIRCULAR CURVE, DIMENSIONING AND LAYOUT FOR REINFORCED CONCRETE SECTIONAL PIPE.

EXAMPLE

Problem: A reinforced concrete pipe with internal diameter of 60 inches and wall thickness of 6" is to be laid on a curve having a central angle (Δ) of 38°-16'. The radius of curvature is to be kept as small as reasonably feasible using standard lengths of pipe and normal fabricating practice. Compute the required cut and coordinates for layout of this pipe curve.

Solution:

The radius of curvature (R) will be smallest for short lengths (L) of pipe and large values of Δ/N. Choose a short standard length L=4' and hold Δ/N as close to, but not over, 5° as possible. Choose number (N) of cut sections of pipe in the curve as 8,

$$\frac{\Delta}{N} = \frac{38°\text{-}16'}{8} = 4°\text{-}47'$$

Solve for the cut (C) as follows:

$$\text{Tan}\,(\Delta/N) = \tan 4°\text{-}47' = 0.08368$$

$$= \frac{C}{d+2T} = \frac{C}{60+12} = \frac{C}{72} \quad \text{or}$$

$$C = 0.08368 \times 72 = 6.02496 \text{ inches} *$$

This cut, to the closest 1/8" for manufacturing purposes, is C=6.0 inches. Tolerances for pipe cut C=6.0" will allow the use of the value C=6.02496" for calculation purposes thruout the rest of the problem. The radius of curvature (R) of the ℄ of the pipe is

$$R = \frac{(2L-C)(d+2T)}{2C}$$

$$= \frac{[8 - 1/12\,(6.02496)][5+(2\times 1/12\times 6)]}{2\times 1/12\times 6.02496}$$

$$R = 44.31 \text{ ft.}$$

The point of tangency of the curve is located

$$\left(\frac{L}{2} - \frac{C}{4}\right) = \frac{4}{2} - \frac{6.02496}{4\times 12} = 1.87 \text{ ft.}$$

downstream from the first cut section to be placed. The offsets to the outside edge of pipe which will be used in laying the pipe are given on the form Calculation Sheet, sheet 3 of 3.

*Permissible to use inches here if d & T are in inches.

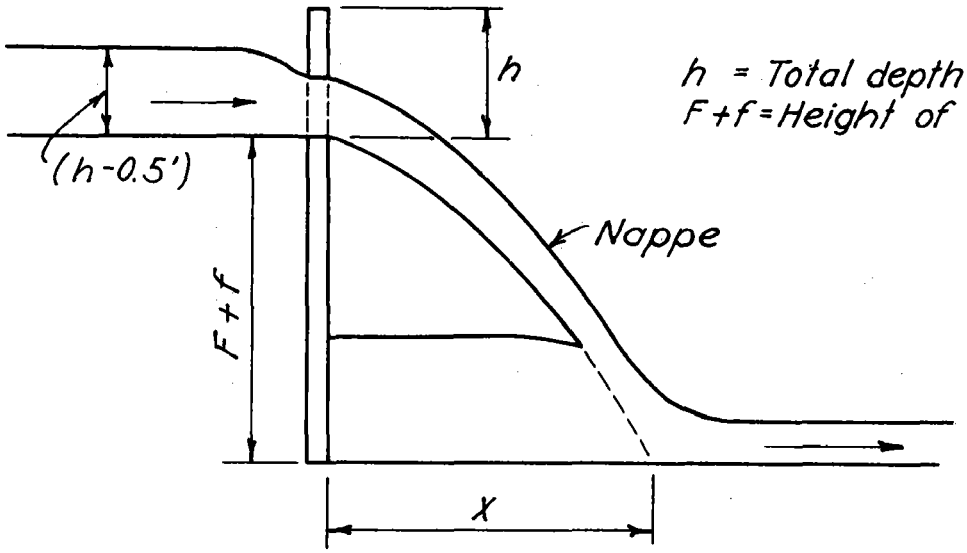
DROP SPILLWAYS: APPROXIMATE HORIZONTAL DISTANCE, (X), TRAVELLED BY THE NAPPE OVER A DROP SPILLWAY



h = Total depth of weir-ft.
F+f = Height of fall-ft.

SCHEMATIC DIAGRAM

$$X = 1.185(F+f)^{\frac{1}{2}}(h-0.5)^{\frac{1}{2}}$$

	Value of X in feet								
F+f \ h	2'-0"	2'-6"	3'-0"	3'-6"	4'-0"	4'-6"	5'-0"	5'-6"	6'-6"
4'-0"	2.90	3.35	3.75	4.10	4.43	4.74	5.03	5.30	5.80
